VIII. Specifications (II)

Objectives

- ▼ To describe the Petri Nets formalism
- ▼ To discuss the Entity Relationship (ER) formalism
- ▼ To provide examples

A resume from previous lesson

- ▼ Operational and descriptive model specifications
- ▼ DFD
- ▼ FSM
 - FSM characteristics and problems when general concurrency need to be represented.

▼ Petri nets are a formalism for specifying **systems that contain parallel or concurrent activities.**

▼ Mathematical model:

– A Petri Net is defined by a quadruple (P, T, F, W) where:

– P is a finite set of places

– T is a finite set of transitions

– $P \cup T \neq \emptyset$

– $F \subseteq \{P \times T\} \cup \{T \times P\}$ is the flow relation

– $W: F \rightarrow \mathbb{N} - \{0\}$ is the weight function which associate a non zero natural value to each element of F (default value is 1)

– $M: P \rightarrow \mathbb{N}$ marking function

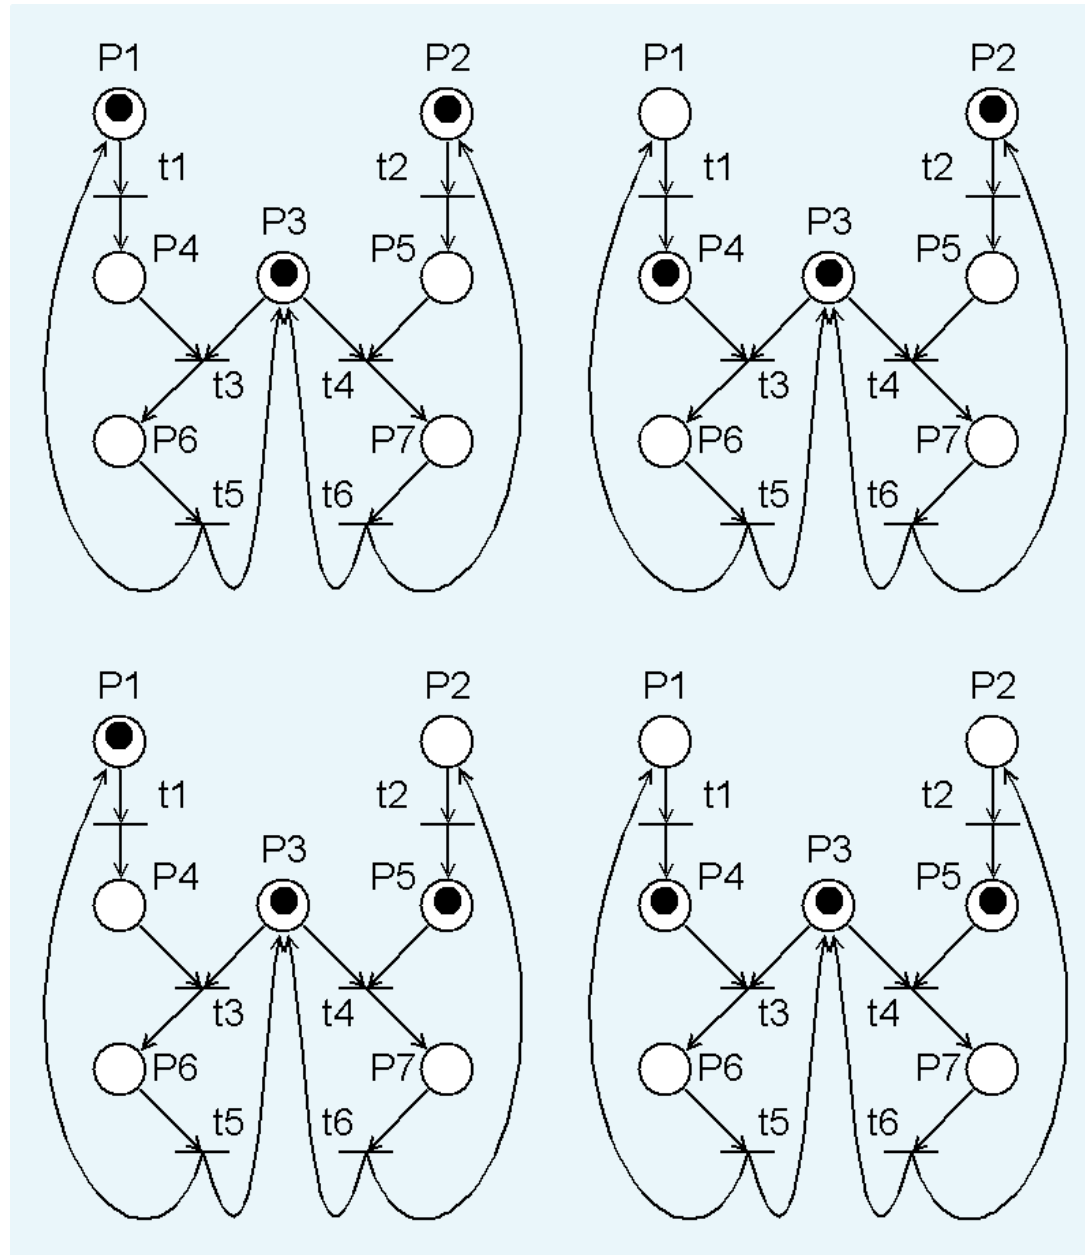

PN generics

PN generics

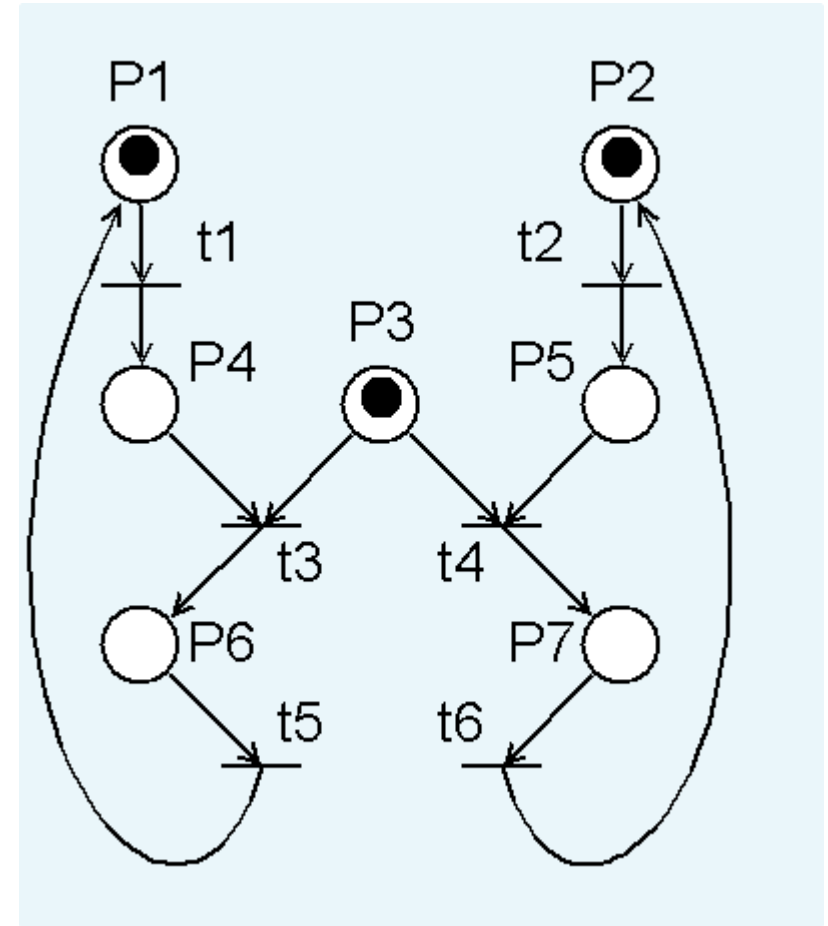

- ▼ Input and Output places
- ▼ A transition is said enabled if each of its input places contains a number of token **equal or greater to the weight of the flow** element connecting the input place to the transition
- ▼ Transition with no input places are always enabled
- ▼ PN are generally **non-deterministic automata**

PN examples

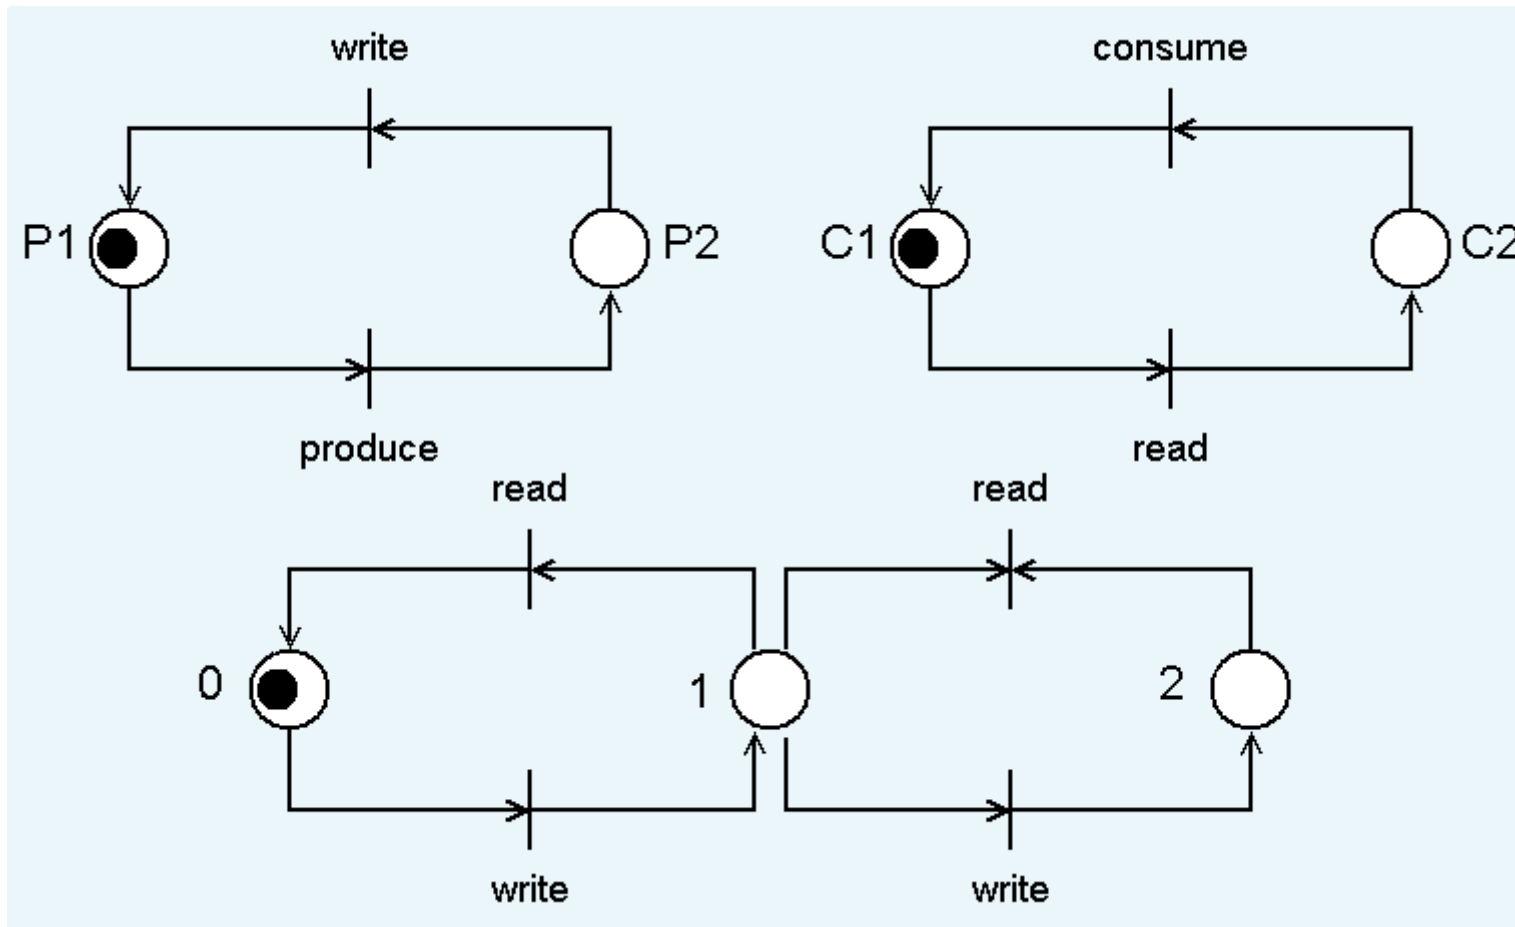

PN generics

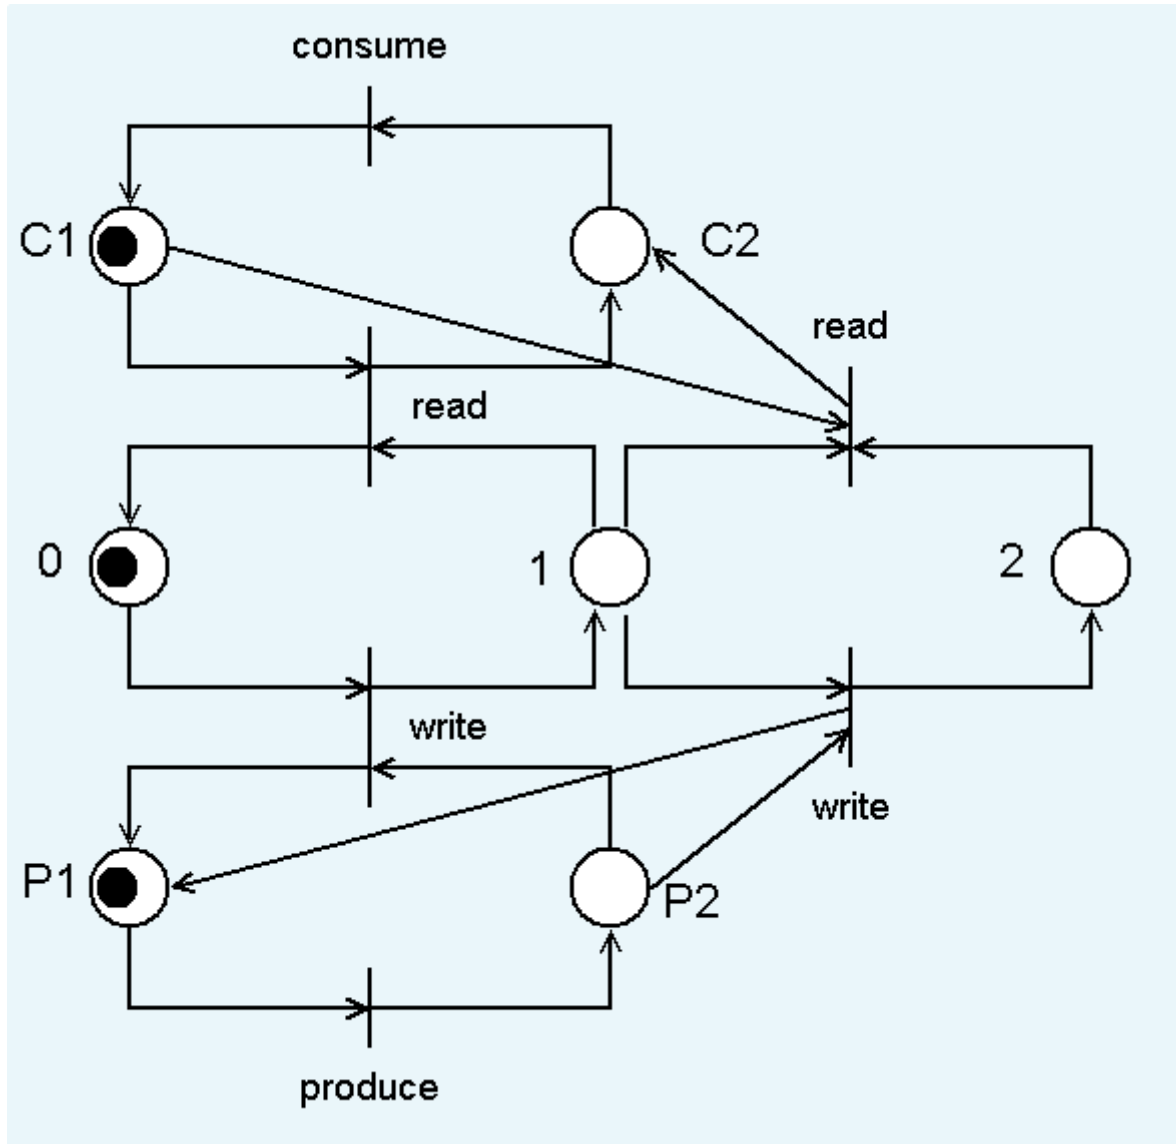

- ▶ PN does not impose any policy to avoid starvation of processes
- ▶ Places can be considered resources and token represent the availability of the resource
- ▶ PN can obviously show

PN producer/consumer/buffer

PN producer/consumer/buffer composed

Limitations and Extensions of Petri Nets

- ▼ Token are **not content based**
- ▼ Timing issues – **time is not explicitly managed by the model**
- ▼ Non determinism can be reduced defining priority functions

- ▼ Timed Petri nets – transitions have associated times of execution
- ▼ Coloured Petri Nets – introduce typed tokens and content management
- ▼ Stochastic Petri Nets – TPN with associate exponential distribution (isomorphic to Markov Chain)

Exercices

- ▼ A Mutual exclusion component
- ▼ Elevator
- ▼ Traffic Light
- ▼ Dining Philosopher (deadlock)
- ▼ Dining Philosopher (deadlock free)

Descriptive Models

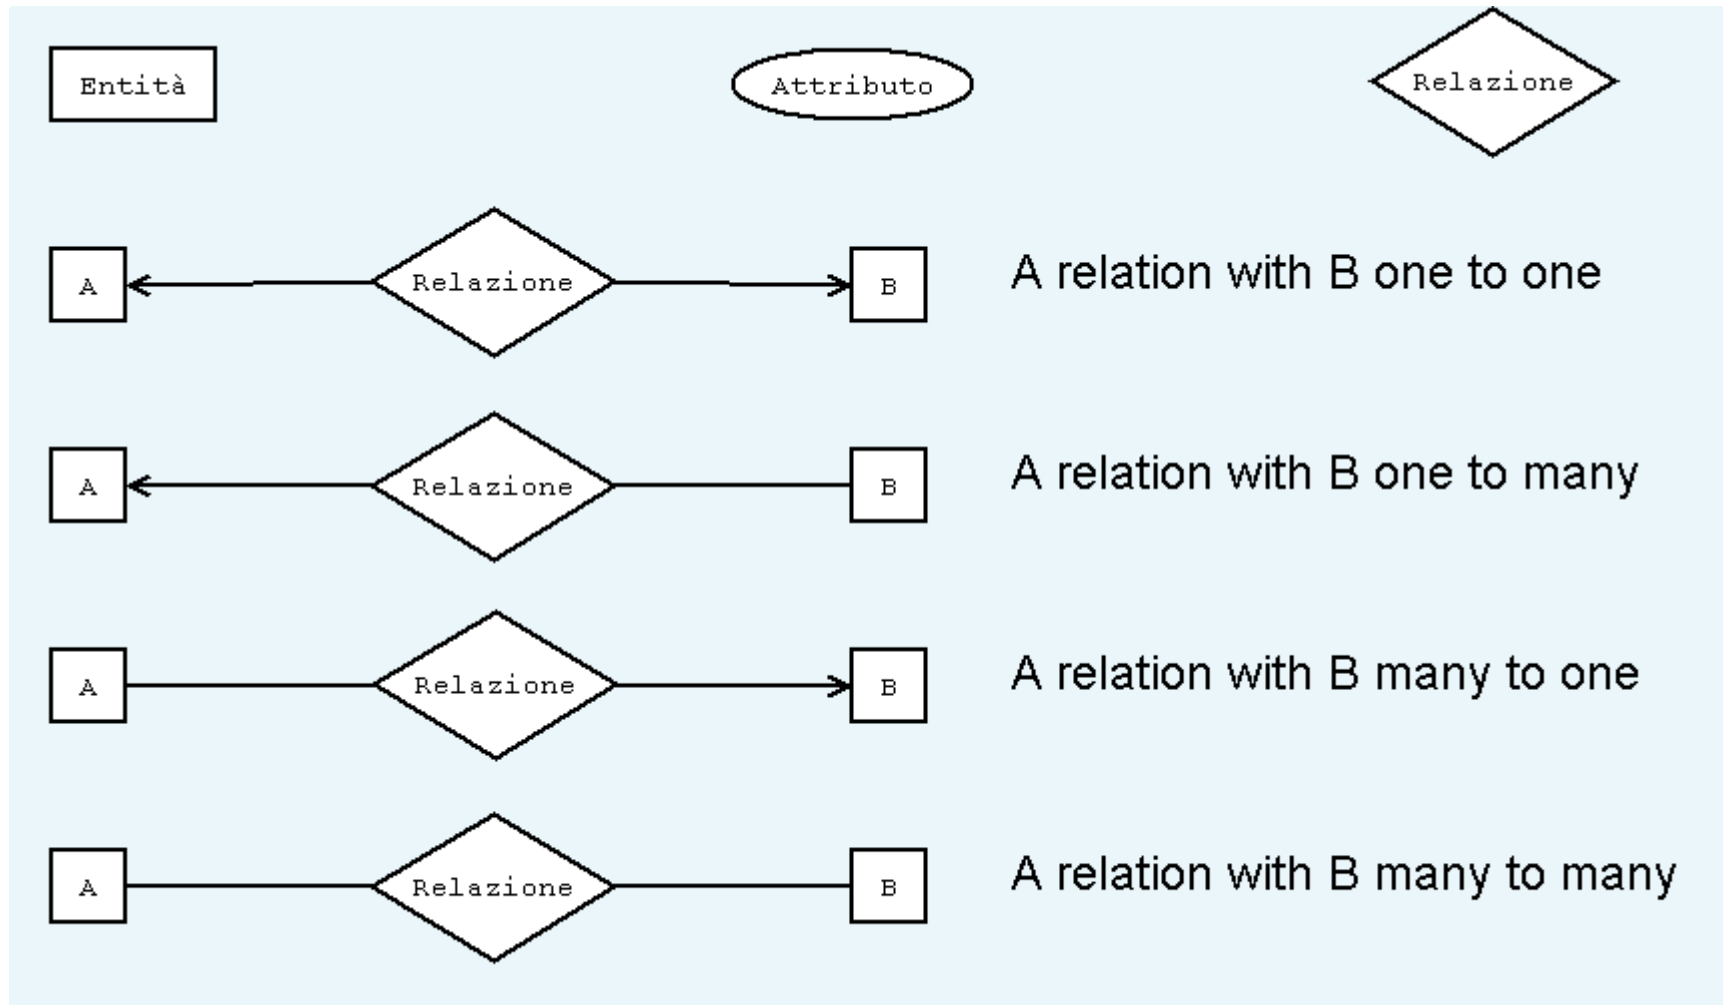

- ▼ Descriptive specification provide a specification of the system in terms of the properties of a system and not of its behaviour
- ▼ We will introduce three main approaches:
 - Semi-formal – Entity Relationship Diagrams
 - Formal based on logic
 - Formal based on algebraic formalism

- ▼ Conceptual description of the structure of the data and their relations
 - DFD focus on the flow but does not specify structure
 - Which one to model first?
- ▼ Widely used notation for describing information systems
- ▼ Three main concepts are represented:
 - Entity
 - Attributes
 - Relations

ER graphical notation

ER limitation

- ▼ ER expressive power are rather limited and more complex concepts cannot be expressed
 - e.g. Relation on the cardinality of the relation (only one or many)
- ▼ In general ER are complemented with comments using formal logic or informal statement
- ▼ Class diagrams and ER
- ▼ ER are widely used given their simplicity

Key Points

- ▼ Operational specifications
 - Petri Nets
- ▼ Descriptive Specification
 - Entity relationship diagrams
